

From a hand-typed bid package to a 30-second, attach-and-go workflow.

A Brooklyn general contractor bids New York City affordable-housing repair work through HPD's Emergency Repair Program. Every job arrives as the same flat bid package — rebuilt by hand, stamped, and signed, one bid at a time.

Instafill.ai turned that package into a single reusable template with the company's data, signature, and stamp built in. Today the team attaches the government file, types a few lines, and gets back a finished, signed PDF in seconds.

01

The challenge

The same government form, rebuilt by hand for every bid.

HPD emails a bid package for each job — a flat PDF with no fillable fields. To submit, someone rebuilds the whole document from scratch, every time:

Re-type the company boilerplate. Contractor, address, phone, fax, owner — on a form that never changes but can't be saved.

Copy the scope into "Remarks." Paste it off the government's page, then shrink the font (9 → 8 → 6 pt) so a long scope fits, and lift material names into the Materials column by hand.

Stamp and sign, every time. Two stamped pages with the current date and a signature in 2–3 places — by hand, on each bid.

Beat the clock. The date changes daily as bids go out; emergency work goes to whoever turns a clean bid around first.

02

What we built

We built the workflow across a two-call onboarding, then handed it over.

Flat → fillable, once. The HPD package became a single reusable template — sample data stripped, real fields added, formatting set. No more uploading a new PDF per job.

Company profile, baked in and locked. Every static field is pre-filled and the AI never touches it — editable any time, invisible work otherwise.

Attach + a few lines. To bid, the team attaches the government OMO PDF and drops a short note: bid price, location, procedures, and materials.

The AI does the tedious part. It summarizes the scope into Remarks, appends the mandatory HPD specifications line, de-duplicates HPD's repeated entries, and lifts material names into the Materials column.

Auto-stamp & stored signature. The stamp lands on both pages with the current date automatically; the signature is uploaded once and embedded on every document, isolated to their workspace.

Human in the loop. Every value is editable in the review screen before download, so a rare exception is a quick fix, not a re-do.

03

Before → after

	BEFORE (MANUAL)	AFTER (INSTAFILL)
Per-bid input	Rebuild the whole package by hand	Attach the file + a few lines of notes
Company data	Re-typed every time	Locked profile, never re-typed
Scope & materials	Copy-paste, shrink font, extract by hand	Auto-summarized, de-duped, materials pulled out
Stamp & signature	Stamped & signed by hand each time	Auto-stamped; signature stored once
Time per bid	Minutes of focused typing	Seconds

04

Results

Live in production, running the contractor's real bids.

~30 sec

TO FILL A FULL BID

372FORM FIELDS PER
PACKAGE**~3 weeks**FIRST CALL TO
LIVE

Live and in production. After the build and one signature edge case, the customer confirmed the workflow was working and moved their real bids onto it.

Fast, at real volume. A full bid package — 372 form fields — completes in well under a minute, versus minutes of manual typing before.

Support that closes loops. The one defect they hit — a signature rotating on a landscape page — was root-caused and fixed within days, then confirmed with them.

05

Why it repeats

The document isn't the contractor's — it's the city's. Every HPD Emergency Repair contractor in New York fills the **same** Invitation-to-Bid package. The boilerplate differs by company; the form and the workflow are identical. Solve it once, and the template is around 90% reusable for the next contractor — swap the company profile and signature, and keep everything else.
